Evaluate Yourself

1. What is meant by type conversion?
2. How implicit conversion is different from explicit conversion?
3. What is the difference between endl and \n?
4. What is the use of references?
5. What is the use of setprecision ( ) ?

Hands on practice:

1. Write C++ programs to interchange the values of two variables.
   a. Using the third variable
   b. Without using third variable
2. Write C++ programs to do the following:
   a. To find the perimeter and area of a quadrant.
   b. To find the area of triangle.
   c. To convert the temperature from Celsius to Fahrenheit.
3. Write a C++ to find the total and percentage of marks you secured from 10th Standard Public Exam. Display all the marks one-by-one along with total and percentage. Apply formatting functions.

Points to Remember

- Every programming language has two fundamental elements, viz., data types and variables.
- In C++, the data types are classified as three main categories (1) Built-in data types (2) User-defined data types (3) Derived data types.
- The variables are the named space to hold values of certain data type.
- There are five fundamental data types in C++: char, int, float, double and void.
- C++ compiler allocates specific memory space for each and every data handled according to the compiler's standards.
- Variables are user-defined names assigned to a memory location in which the values are stored.
- Declaration is a process to instruct the compiler to allocate memory as per the type specified along with the variable name.
- Manipulators are used to format output of any C++ program. Manipulators are functions specifically designed to use with the insertion (<<) and extraction(>>) operators.
- An expression is a combination of operators, constants and variables arranged as per the rules of C++.
- The process of converting one fundamental data type into another is called as "Type Conversion". C++ provides two types of conversions (1) Implicit type conversion and (2) Explicit type conversion.
