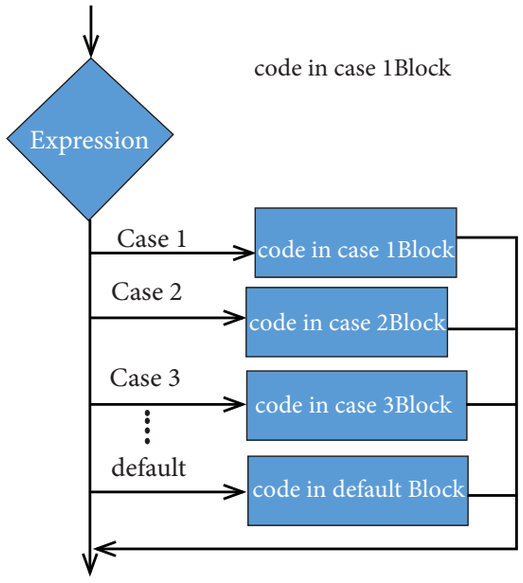
The syntax of the switch statement is;

```
switch(expression)
{
        case constant 1:
                statement(s);
                break;
        case constant 2:
                statement(s);
                break;
        .
        .
        .
        .
        default:
                statement(s);
}
```

In the above syntax, the expression is evaluated and if its value matches against the constant value specified in one of the case statements, that respective set of statements are executed. Otherwise, the statements under the default option are executed. The workflow of switch statement and flow chart are shown below.



Flowchart10.5: workflow of switch and flow chart

Rules:

1. The expression provided in the switch should result in a constant value otherwise it would not be valid.
2. Duplicate case values are not allowed.
3. The default statement is optional.
4. The break statement is used inside the switch to terminate a statement sequence. When a break statement is reached, the switch terminates, and the flow of control jumps to the next line following the switch statement.
