Note

If all members of the class are defined as private ,then the object of the class can not access anything from the class.

Activity 1

State the reason for the invalidity of the following code fragment

(i)	(ii)

class count
{
int first;
int second;
public:
int first;
};
	class item
	{
	int prd;
	};
	item int prdno;

14.1.4 Definition of class members

Class comprises of members. Members are classified as Data Members and Member functions. Data members are the data variables that represent the features or properties of a class. Member functions are the functions that perform specific tasks in a class. Member functions are called as methods, and data members are also called as attributes.

Example

```
Class result                          Data members
{
Private;
        char name [10];
        int rollno,mark1, mark2, total;

Public:
        void accept();
        void display();
};                                    Member functions
```

Note

Classes also contain some special member functions called as constructors and destructors.

14.1.5 Defining methods of a class

Without defining the methods (functions), class definition will become incomplete. The member functions of a class can be defined in two ways.

(1) Inside the class definition

(2) Outside the class definition

(1) Inside the class definition

When a member function is defined inside a class, it behaves like inline functions. These are called Inline member functions.

Note

If a function is inline, the compiler places a copy of the code at each point where the function is called at compile time.

(2) Outside the class definition

When Member function defined outside the class just like normal function definition (Function definitions you are familiar with) then it is be called as **outline member function or non-inline member function. Scope resolution operator (::) is used for this purpose.** The syntax for defining the outline member function is
