4.5 Construction of Parallel Lines

Place a scale on a paper and draw lines along both the edges of the scale as shown.

Place the set square at two different points on ℓ_1 and find the distance between ℓ_1 and ℓ_2. Are they equal? Yes. Thus, the perpendicular distance between a set of parallel lines remains the same.

Note

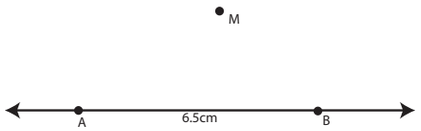

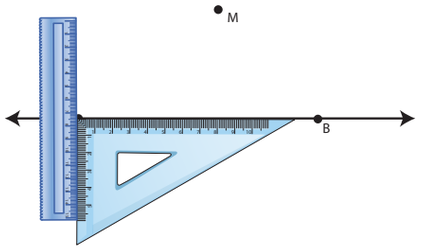

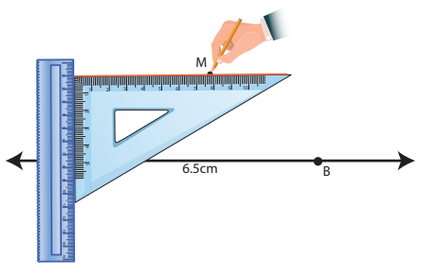

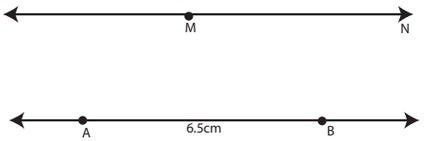

Parallel line segments need not be of equal length

Think

Identify the parallel lines in English alphabets (Capital Letters) and list the letters.

Examples: E W

Example 7: Draw a line segment AB = 6.5 cm and mark a point M above it. Through M draw a line parallel to AB.

Step 1: Draw a line. Mark two points A and B on the line such that AB = 6.5 cm. Mark a point M anywhere above the line.	
Step 2: Place the set square below AB in such a way that one of the edges that form a right angle lies along AB. Place the scale along the other edge of the set square as shown in the figure.	
Step 3: Holding the scale firmly, Slide the set square along the edge of the scale until the other edge of the set square reaches the point M. Through M draw a line as shown.	
Step 4: The line MN is parallel to AB. That is, MN ∥ AB
