The non-amino acid group is termed as Prosthetic group (e.g.) Lipoproteins - Chylomicrons

c) **Derived proteins:** These are derivatives of proteins resulting from the action of heat, enzymes or chemical reagents. This group also includes the artificially-produced polypeptides(e.g.)Fibrin

### 10.3.3 Classification of proteins (Based on nutritional value)

Proteins are classified into two types based on nutritional values as follows:

1) **Complete proteins:** These contain all the essential amino acids in sufficient quantity to supply the needs of the body. They support life even if supplied as the sole source of protein. These proteins are of animal origin (e.g) milk, meat, poultry, egg and fish. The quality of these proteins is much superior to those of incomplete proteins.

2) **Incomplete proteins:** These proteins are deficient in one or more of the essential amino acids and therefore, they do not support life on their own. All plant sources of proteins (i.e) vegetables, fruits, cereals, pulses, nuts and oilseeds contain incomplete proteins to varying degrees.

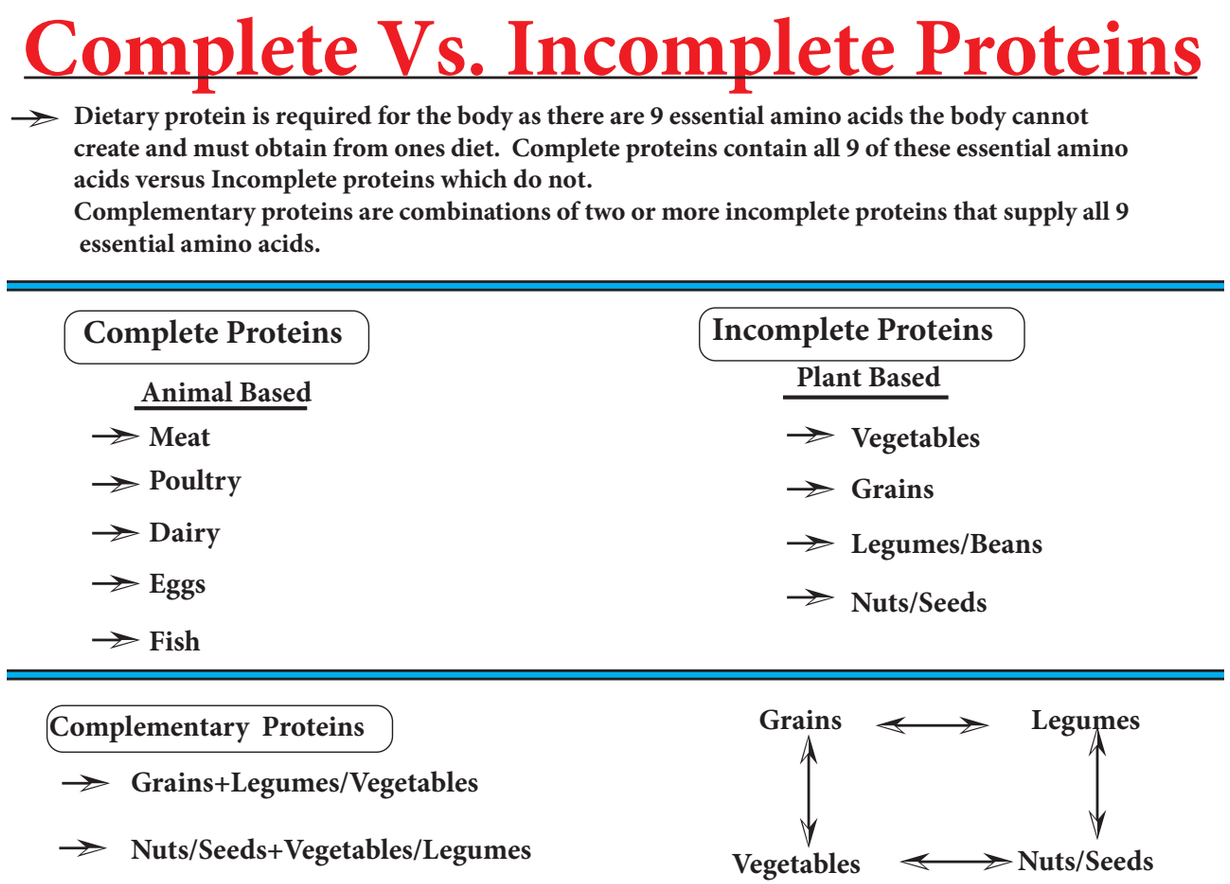

**Fig 10.4:** Complete Vs Incomplete protein
