

Fig 10.21: Effects of EFA deficiency - Phrynoderma

DO YOU KNOW...?

Ketosis is a normal metabolic process. When the body does not have enough glucose for energy, it burns stored fats instead; this results in a build-up of acids

ACTIVITY - 6

1) How is excess fat or cholesterol in the body linked with heart disease?
2) What is known as Good cholesterol and Bad cholesterol?

SUMMARY

- Proteins are the building blocks of life.
- Proteins are used for tissue repair and maintenance.
- Amino acids are small units that combine to form a protein molecule.
- Aminoacids are classified as essential, semiessential and non essential aminoacids.
- Proteins are classified as simple proteins, conjugated or complex proteins and derived proteins.
- Proteins are also classified as complete proteins and incomplete proteins.
- If two sources of incomplete proteins are combined in the same meal, the resulting protein may be of better quality. These are called as Complementary proteins.
- Animal sources are complete proteins which includes meat, egg, fish and poultry and they are good protein foods in both quantity and quality. Milk is a valuable source of protein because although it does not contain a large quantity of protein, the quality is excellent.
- Good sources of plant proteins are legumes, pulses, nuts and oil seeds, but their quality is poorer than that of animal foods.
- All vegetables and fruits are a poor source of protein.
- The main functions of protein are building and repair of body tissues and regulation of body processes.
- Protein Energy Malnutrition (PEM) is defined as a range of pathological conditions arising from coincident lack of varying proportions of protein and calorie ,occurring most frequently in infants and young children and often associated with infection.
- The treatment of PEM include hospital based management and dietary management.
