Unit 11

Vitamins, Minerals and Water

Vitamins and Minerals are micronutrients. They help to protect body from diseases. These micronutrients must be provided through the food we eat or through supplements. Vitamins are complex organic molecules that serve primarily as coenzymes or regulators of body metabolism. Minerals in contrast, are simple elements with important roles in both structure and function of the body. Water is one of the most important substances on earth's surface. All plants and animals depend on water for survival. Intake of water and loss must be balanced. Water is obtained through food and drinking water. Water balance in the body is regulated by minerals like sodium and potassium.

In this lesson, the students will be able to:

- understand different types of vitamins, minerals and their functions in the body.
