3.2 Perimeter

Activity

Observe the following shapes and answer the questions given below:

i) Mark the closed shapes as '✓' and open shapes as 'x'.

ii) Find the measure of the boundary of closed shapes by using a ruler.

iii) Which closed shape has the shortest boundary?

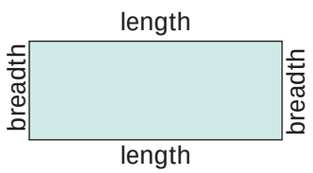

iv) Which closed shape has the longest boundary?

The length of the boundary of any closed shape is called its ***perimeter*.** Hence, 'the measure around' of a closed shape is called its ***perimeter***. The unit of perimeter is the unit of length itself. The units of length may be expressed in terms of metre, millimetre, centimetre, kilometre, inch, feet, yard etc.,

DO YOU KNOW?

The word perimeter is derived from the Greek words 'peri' and 'metron', where 'peri' means 'around' and 'metron' means 'measure'.

3.2.1 Perimeter of a Rectangle

Perimeter of a rectangle = Total boundary of the rectangle

= length + breadth + length + breadth

= 2 length + 2 breadth

= 2 (length + breadth)

Let us denote the length, breadth and the perimeter of a rectangle as l, b and P respectively.

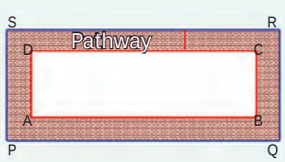

Perimeter of the rectangle, P= 2 x (l + b) *units*

Note

In a rectangle the opposite sides are equal in length.

DO YOU KNOW?

For the pathway shown in the figure, the outer boundary of the pathway is PQRS and its inner boundary is ABCD.
