In the given figures, the red coloured line divides each figure into two equal halves and suppose we fold them along that line, we will see that one half of each figure exactly coincides with the other half. Such figures are symmetrical about that line and that line is called ***the line of symmetry or the axis of symmetry.***

Look at the given invitation cards, the fold line of the first card divides it into two equal halves and each half exactly coincides. Hence it is a line of symmetry but in the second card, the fold line does not divide it into two equal halves. So,it is not a line of symmetry.

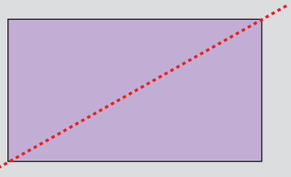

A figure may have one, two, three or more lines of symmetry or no line of symmetry.

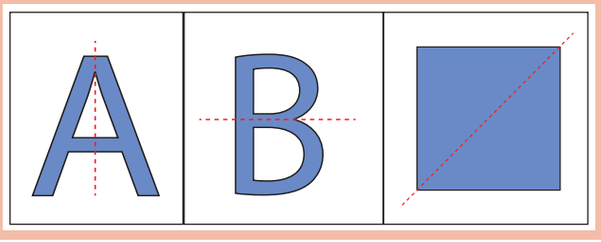

Think

The diagonal of a rectangle divides it into two equal halves but it is not a line of symmetry. Why?

Note

The line of symmetry can be vertical, horizontal or slant.

DO YOU KNOW?

The word “symmetry” comes from the Greek word “symmetros” which means “having a common measure”.

Some examples for Symmetry

Symmetry can be found anywhere in nature as well as in man-made objects. A few of them are leaves, insects, flowers, animals, note books, bottles, architecture, designs and shapes, etc.,
