Example 4

Observe the given 4 x 4 square grid and follow the instructions given below to appreciate the uniqueness of the arrangement of numbers that gives the total 139.

22	12	18	87
88	17	9	25
10	24	89	16
19	88	23	11

Instructions

- Add the numbers horizontally.
- Add the numbers vertically.
- Add the numbers diagonally.
- Add the numbers in the four corners of the square.
- Divide the square into four 2 x 2 squares and add all the numbers in each of the squares.

Each of the above instructions gives the same answer. Doesn't it?

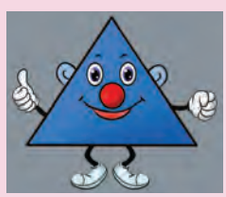

In all the above examples, we note that delivering instructions as well as following them are interesting.

Try these

1. The teacher should give oral instructions to the students to draw the geometrical figure already drawn by him / her.

   i) Draw a square. In the middle of the square, draw a circle in such a way that the circle does not touch any side of the square. Divide the circle into four equal parts. Shade the bottom right part of the circle. Ask the students to show that figure drawn by them.

   ii) Draw a triangle on a piece of paper. Make it crazy looking by adding some features. Give instructions to your friend to draw it exactly the same.

2. Suppose your friend wants to come to your house from his / her house. Give clear instructions in order, to reach your house.

5.5 Arranging things and putting them in order

In day-to-day life, sorting things such as arranging books on shelves, lining up foot wears in racks, segregating vegetables in trays, keeping household things in an almirah, arranging provisions in a cupboard, listing out expenditure etc, become inevitable. These activities help us to recall the things available, to have an easy access, avoid wastage and so on. Similar kind of arrangements are available in numbers also. Example : Calendar.
