$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$ is $8.19 \times 10^2$ at 298 K and $4.6 \times 10^{-1}$ at 498 K. Calculate $\Delta H^0$ for the reaction.

50. The partial pressure of carbon dioxide in the reaction

$CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$ is $1.017 \times 10^{-3}$ atm at $500^0$ C. Calculate $K_p$ at $600^0$ C for the reaction. $\Delta H$ for the reaction is 181 KJ $mol^{-1}$ and does not change in the given range of temperature.
