LEARNING OUTCOMES

Through this Chapter, the student will

1. **Acquire basic knowledge in sinusoidal and non sinusoidal waves.**
2. **Understand how the oscillator circuit is essential for communication equipment.**
3. **Understand the use of positive feedback in an oscillator.**
4. **Understand bistable multivibrator as the foundation of digital electronics.**

GLOSSARY

S. No	Terms	Explanation
1	Amplitude	Magnitude or size of a signal or voltage
2	Bandwidth	It is a range of frequencies or information, that a circuit can handle
3	Crystal	A crystalline piece of semiconductor used as an oscillator
4	Damped	To cause a decrease in amplitude of successive oscillations or waves
5	Feedback	A part of output signal from an amplifier is given to the input of the same device
6	Frequency	The number of cycles occur at a particular period of time
7	Multivibrator	A device consisting of two amplifying transistors, each with its output connected to the input of the other, which produces an oscillator signal
8	Non sinusoidal	Other than sine wave (square, triangular, rectangular and sawtooth wave)
9	Oscillation	Regular variation in magnitude or position about a central point, especially of an electric current or voltage
10	Phase shift	A change in phase of a waveform
11	Regeneration	Positive feedback
12	Resonant circuit	A resonant, or tuned circuit combines an inductor and capacitor to make a circuit that is responsive to a frequency
13	Sinusoidal	Having a form of sine curve, a sinusoidal waveform
14	Synchronization	The operation or activity of two or more things at the same time or rate
15	Undamped	Oscillations having constant amplitude
