Keep the value of '2' in your memory. Leave three fingers and start to count three, four, five, etc.

Just like the same we have to instruct the computer. For your easy understanding there is an example.

1. The first line A = 2 means we are asking the computer to keep the value of '2' in the memory location called 'A'.
2. Then B = 3 means we are asking the computer to keep the value of '3' in the memory location called 'B'.
3. C = A + B means asking the computer to keep the sum of A, B in the third memory location called 'C'.
   (Performing this addition process is done by exclusive part in computer. That we see later.)
4. Since the result is in 'C', we are asking the computer to show the result of 'C' i.e., PRINT C the result will be displayed on the screen.
5. Then the last one is END.

Here, the last two words 'PRINT & END' are new to us. All other are just like mathematical terms.

In mathematical A = 2 means, the value of 'A' is 2, whereas in computer terminology A = 2 means, we are asking the computer to keep the value of '2' in the memory location called 'A'. B = 3 means, keep the value of 3 in the memory location called 'B'.

John Napier (1550–1617)	
Born	February 1, 1550, Merchiston Tower, Edinburgh, Scotland
Died	4 April 1617 (Aged 66–67) Edinburgh, Scotland
Nationality	Scottish
Alma mater	University of St Andrews
Known for	Logarithms Napier's bones, Decimal notation
Scientific Career	
Fields	Mathematician
Influenced	Henry Briggs

Blaise Pascal (1623-1662), the French philosopher and scientist, was one of the greatest and most influential mathematicians of all time. He was also an expert in hydrostatics, an inventor, and a well-versed religious philosopher.
