As we have seen earlier in third generation language even a small procedure can be executed only by writing four or five lines (instruction).But in fourth generation language we can execute few things directly (even without writing few lines).

For Example, in FoxPro language after giving a question mark ?10 + 20 and press enter. You will get the answer as 30. Whereas in COBOL(III- generation language), if you give as like above, it won't give you the answer. Because here in III-generation if we give10 + 20, the computer cannot understand what is meant by this 10 and 20 (since the computer doesn't know anything on its own).

Then, how it becomes possible in fourth generation language like FoxPro? Even, there the computer doesn't know anything, then how the answer 30 comes.

> ***Please remember whatever we are giving to the computer it should be referred to its memory.***

So in FoxPro, if we give any value after giving a question mark(?), it will be referred to a memory as shown in Figure 9.10.

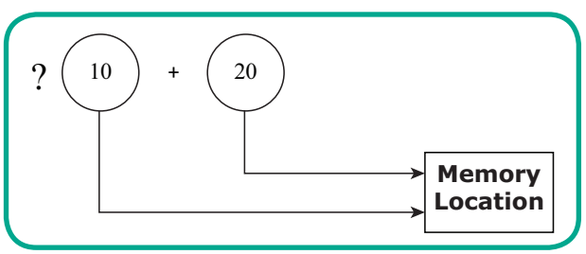

Figure 9.10 Addition in FoxPro

These referring instructions were given inside the FoxPro language itself. Hence, it is enough to give remaining instructions. But in third generation language, no such referring instructions were written inside the language. So we have to instruct the computer from minimum level.

If we want to understand the advantage of fourth generation language, it is better to understand the difference between the both.

Difference between III & IV Generation Language

In third generation language anything (even a small task) can be done only by writing a program. But, in fourth generation language, we can do few things (small task) even without writing a program. Since, we can directly use the fourth generation language, it is termed as Application Language or Packages.

9.4. MAJOR PARTS OF COMPUTER

Figure 9.11 Parts of the Computer

But to be precise only one particular part is said to be computer. To understand this let us see the working of each part illustrated in Figure 9.11.

Teacher: From the above, which is the computer?

Student: All the parts, Sir.

Teacher: Hmm... ofcourse...

1. ***KEYBOARD:*** It is a device which is used to give any data or instruction to the computer.
