Table 9.2: Memory Capacity	
0	Bit
1	Bit
8Bits	1 Byte
1024 Bytes	1 kilo Byte
1024 KB	1 Mega Byte
1024 MB	1 Giga Byte
1024 GB	1 Terra Byte

9.6.3 CONTROL UNIT

In general the computer is doing various activities besides handling many peripherals. In order to monitor and control all these, a system is used, which is called as control unit.

9.6.3.1 Controls Input Device

Assume that you are typing a matter consist of many pages. While you are typing speedy, we press one or more keys at a time. That moment, the respective letters altogether try to enter into the RAM, which is not possible. By that time the control unit will take charge and block it and give a beep sound. On hearing beep sound, we can able to identify that we are doing something wrongly. Thus, the control unit is controlling the input device, i.e., keyboard.

9.6.3.2 Controls Output Device

Assume that you typed around 50 pages of a matter. Now the matter is in RAM and you want to take a print-out. On giving print command, all the 50 page content will try to go to the printer, which is not possible. Here too, the printer and CPU are interfaced through a set of wires. It is possible to travel or send data with reference to the capacity of the wire, but all the pages tend to go at a time. This is explained by the following example.

Example:

- Assume a class room
- Evening closing bell rang.
- There is only one door in the class room.
- What the students will do?
- Everyone will tend to go-out of the class through the single door.
  By that time if a master is there, he will control them and regulate to go one by one.

Just like students, here all the pages will tend to go to the printer, which is not possible. There the control unit is taking charge, regulate and send little by little to the printer. Thus, the control unit controls the output device.

9.6.3.3 Controls both I/P and O/P Devices

E.g.: Assume that there is a movie in a pen-drive and you want to view it.

After inserting the pen-drive into the respective slot, you will click the particular icon. Now the entire movie will try to go to the RAM (Live Memory). Once again the pen-drive(External Memory) and the RAM(Internal Memory) is connected through set of wires, which cannot transfer entire data at a time. Now the control unit will take charge, regulate and send little by little to RAM. Now, the control unit controls both input and output devices.

Thus, the control unit controls the entire system. Without the concern of the control unit nothing can be done in the system.

Control unit – Is as like a father in a family.
