

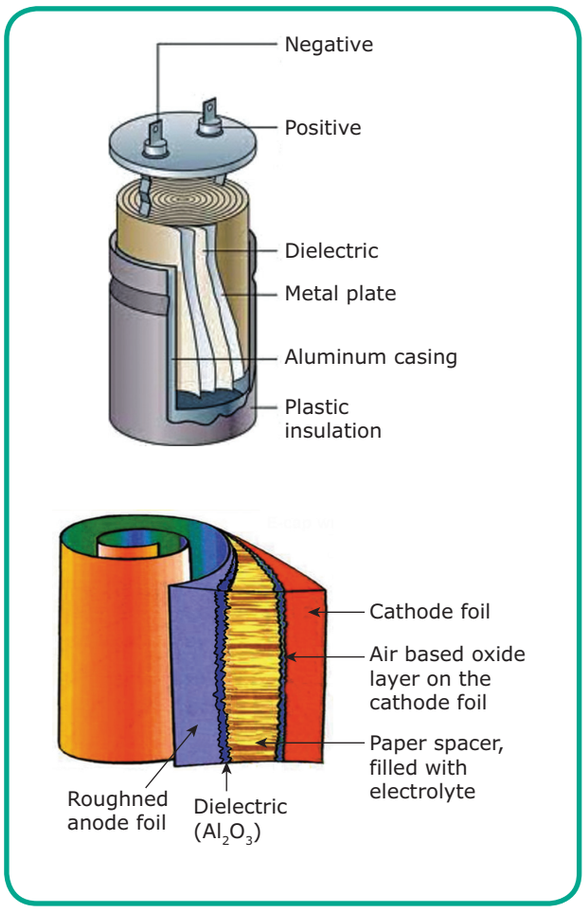

Figure 1.59 **Electrolytic capacitor**

i.e., +ve terminal should be connected with +ve terminal of DC and – terminal of capacitor should be connected with – ve terminal of DC supply.

Electrolytic capacitors should be connected in correct polarities.

Otherwise the capacitor will burst out which is very dangerous.

Available capacitor values are from 0.47μF to 4700μF and voltage rating from 3V to 500V.

Uses

1. Filtering
2. Used in inverters
3. Used for photo flash

1.11.7.1.6 Bipolar Electrolytic Capacitor

Figure 1.60 shows a bipolar electrolytic capacitor.

Figure 1.60 **Bipolar electrolytic capacitor**

This type has two oxide coated anodes. Hence, it has no polarity and can be connected in an AC supply without looking polarities.

Uses

1. Used in starting the AC motors.
2. Used in CRT model TV receivers.

1.11.7.1.7 Tantalum Capacitors

Figure 1.61 shows a tantalum capacitor.

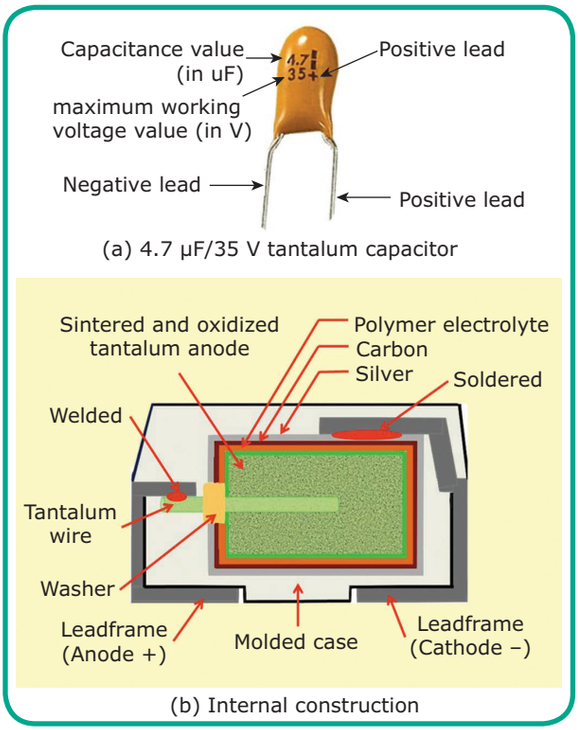

Figure 1.61 **Tantalum capacitor**
