17. Draw two parallel lines and a transversal. Mark two corresponding angles A and B. If $\angle A = 4x$ and $\angle B = 3x + 7$, find the value of x. Explain..

18. In the figure AB is parallel to CD. Find $x°$, $y°$ and $z°$.

19. Two parallel lines are cut by a transversal. If one angle of a pair of corresponding angles can be represented by 42° less than three times the other. Find the corresponding angles.

20. In the given figure, $\angle 8 = 107°$, what is the sum of the $\angle 2$ and $\angle 4$?

5LPGXV

Summary

- Two angles which have a common vertex and a common arm, whose interiors do not overlap are called adjacent angles.
- The adjacent angles that are supplementary are called linear pair of angles.
- The sum of all the angles formed at a point on a straight line is 180°.
- The sum of the angles at a point is 360°.
- When two lines intersect each other, two pairs of non-adjacent angle formed are called vertically opposite angles.
- A transversal is a line that intersects two or more lines at distinct points.
- when two parallel lines are cut by a transversal,
  - ◇ each pair of corresponding angles are equal.
  - ◇ each pair of alternate Interior angles are equal.
  - ◇ each pair of alternate exterior angles are equal.
  - ◇ interior angles on the same side of the transversal are supplementary.
  - ◇ exterior angles on the same side of the transversal are supplementary.
