Think

What would happen to the angles if we add 3 or 4 or 5 rays on a line as given below?

We can learn one more result on linear pairs.
Observe the following Fig.5.9.
AB is a straight line. OC is a ray meeting AB at O.
Here, $\angle AOC$ and $\angle BOC$ are linear pair.
Hence $\angle AOC + \angle BOC = 180°$
Also, OD is another ray meeting AB at O.
Again $\angle AOD$ and $\angle BOD$ are linear pair.
Hence $\angle AOD + \angle BOD = 180°$
Now, $\angle AOC$, $\angle BOC$, $\angle AOD$ and $\angle BOD$ are the angles that are formed at the point O.
We can observe that $(\angle AOC + \angle BOC) + (\angle AOD + \angle BOD) = 180° + 180° = 360°$.
So, the sum of all angles at a point is 360°.

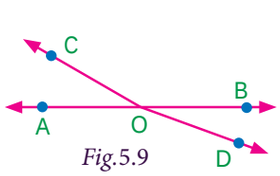

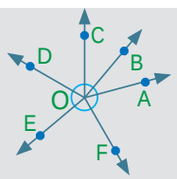

Fig.5.9

Think

Can you justify the following statement.
$\angle AOB + \angle BOC + \angle COD + \angle DOE + \angle EOF + \angle FOA = 360°$?

3WUXU8

Example 5.6 From Fig.5.10, find the measure of $\angle ROS$.

Solution

We know that $\angle QOR + \angle ROS + \angle SOP = 180°$
$26° + \angle ROS + 32° = 180°$
$\angle ROS + 58° = 180°$
Subtracting 58° on both sides
We get, $\angle ROS = 180° - 58° = 122°$

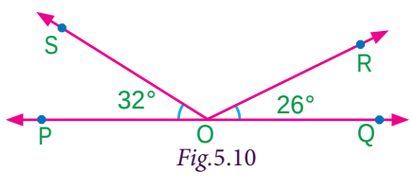

Fig.5.10

Example 5.7 In Fig. 5.11, find the value of $x°$

Solution

$98° + 23° + 76° + x° = 360°$
$197° + x° = 360°$
$x° = 360° - 197° = 163°$

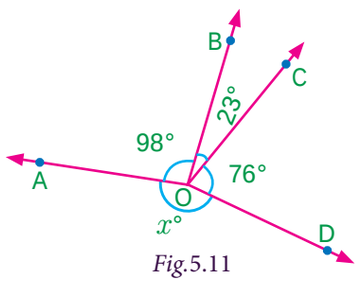

Fig.5.11

5.2.3 Vertically opposite angles

We have already studied about intersecting lines. Observe the Fig.5.12. There are two lines namely l and m which are intersecting at a point O and forming four angles at that point of intersection. They are $\angle 1$, $\angle 2$, $\angle 3$ and $\angle 4$.
