2. **Hydraulic action**: The waves force water and air into the cracks in the rock. The parcel of air can be compressed by the surging water and the waves retreat, air expands explosively, weakening the joints and cracks and causing the rock to break. This is called the Hydraulic action.
3. **Corrosion**: The action of dissolving soluble rocks by waves is termed as the corrosion or solution.
4. **Attrition**: Eroded materials like boulders and rocks knock together to wear out into smaller particles. This is called attrition.

Terms related to coast

- **Sea shore** is the zone of land between high tide and low tide
- **Shore line** is boundary between land and water.
- **Backshore** is the beach zone starting from the limit of frequent storm waves to the cliff base.
- **Foreshore** is the portion of the beach subject to wave action during non-storm conditions.
- **Offshore** is the shallow zone of the continental shelf
- **Coastline** is the boundary where the land meets the sea
- **Swash** is the waves washing up the beach.

4.10.2 Landforms by the Erosion of Waves

Erosional landforms dominate rocky coasts but are also found in association with predominantly depositional landforms.

1. **Sea cliff** is steep rocky coast rising almost vertically above seawater is called sea cliff.
2. **Wave Cut Platform**: Rock cut flat surfaces in front of a cliff are called wave-cut platform. They are slightly concave upward. It is also formed when blowhole is collapsed.

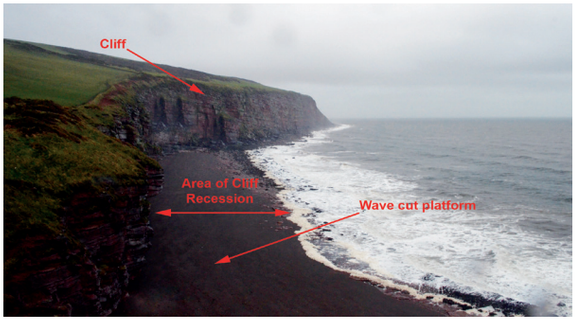

Figure 4.27 Sea cliff and wave cut platform

3. **A sea cave** is a hollow excavated by waves in a zone of weakness on a cliff. The cave depth is greater than the entrance width.

Sea caves usually form at points of geological weakness, such as bedding planes, joints, and faults. A 90 meter long sea cave is found in the Loliem beach in Canacona in Goa. The world's most extensive cave is 1.5 km long Matainaka cave in New Zealand.

4. **A blowhole** may form in the roof of a sea cave by the hydraulic and pneumatic action of waves, with fountains of spray
