emerging from the top. If blowholes become enlarged, they may collapse.

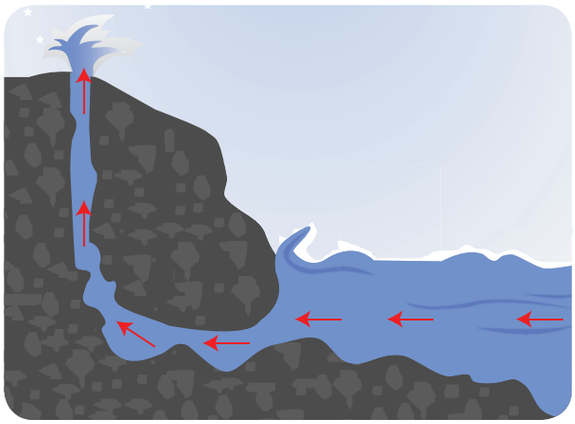

Figure 4.29 Blow hole

5. **Arch** is formed when the sea cave is cut right through by wave action. The arch is termed as sea tunnel if it is comparatively longer.
6. **The stack** is a steep and often vertical column of rock in the sea near a coast, formed by wave erosion.

It is formed when the natural arch is collapsed. It is also called chimney rock, needles, columns, pillars, skerries, etc,

7. **Stump** is the worn out stack.

4.10.3 Transportation Work of Waves

The eroded materials are transported by the waves in different ways. The materials involved in the transportation by sea waves include silt, sand, gravel, cobble, pebble and boulder.

4.10.4 Landforms by the deposition of waves

Depositional landforms developed by the sea waves include the beach, bar, lagoon, spit, tombolo, barrier island, etc. Let us see one by one in detail.

1. **Beach** is an elongated stretch of sands, pebbles, gravels, etc deposited along the coast. It can be a sandy beach or pebble beach. Praia da Cassino beach in Brazil is the world's longest beach stretching for 200 km from the Rio Grande to the border with Uruguay. Marina beach, Chennai is the second longest beach in the world.
2. **The Bar** is a stretch of sand deposition off the shoreline. The larger form of a bar is called barrier.
