

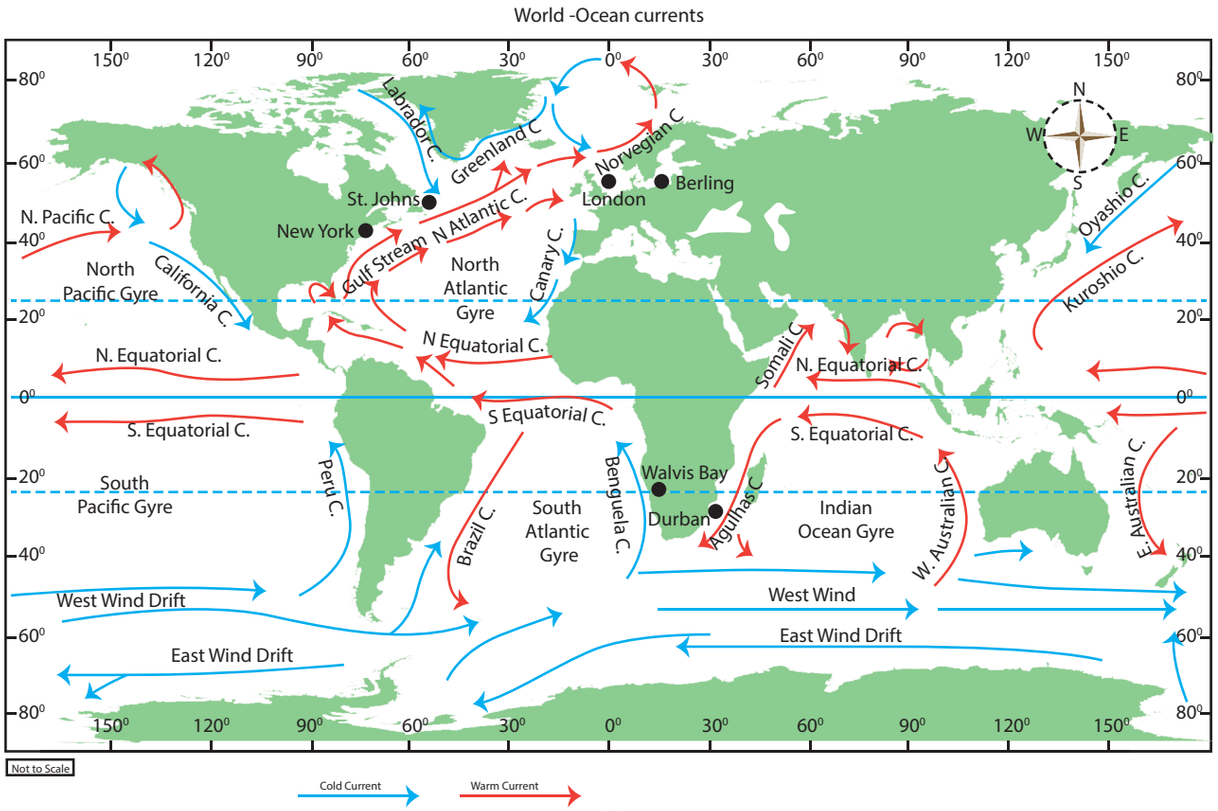

Figure 5.18 World-Ocean currents

branch abruptly turns and forms the Pacific counter current.

2. **South equatorial current.**

   South equatorial current is originated due the action of the trade winds from east to west. It is a warm current. It extends for about 13,600km from east to west. It is stronger than the North equatorial current. It is further divided into many branches due to the presence of many islands and uneven surface topography.

3. **Kuroshio current (Black Tide)**

   It is a warm ocean current flowing in north easterly direction up to 30° N latitude and it carries warm water off the Formosa coast. It flows towards north and meets Oyashio cold current off the Kuril Islands. It is also called as **Japan current**.

4. **Oyashio Current(Parental Tide)**

   It originates from the Bering Strait and flows towards south carrying cold water. It is a cold current. It meets with Kuroshio warm current and Aleutian current.

5. **Californian Current.**

   Californian current is flowing towards south along the west coast of U.S.A between 23° N and 48° N latitudes. It is cold current which exhibits great amount of up welled water. When it enters the region of Trade winds, it is deflected to the right and joins the equatorial current.

6. **Peru Current.**

   Peru Current is perhaps the best studied ocean current of the Pacific Ocean. Alexander Von Humboldt in 1802 noted the details of the Peru Current. Hence, it is also known
