2. Arrange four (4) plastic drinking straws to form a cross and tape them together at the centre.
3. Staple the top side of one drinking cup, such as the small paper cups designed for bathroom dispensers, at the end of each straw, so the open ends of the cups all face the same direction.
4. Push a straight pin through the centre of the straws into an eraser on the end of a pencil. This provides the axle.
5. Mark one of the cups; this will be the one they use for counting when the anemometer spins.
6. Blow on the anemometer or turn an electric fan on low to make sure that it spins easily. How many times the anemometer will spin in one minute? Can you make a statement connecting the number of spins of your anemometer and the speed of the wind? (You can use the table below to record your practice trials).

B. Use an Anemometer to measure Wind Speed

Materials

- Anemometer

1. Divide the students into small groups with the following roles (optional)
   - One time keeper who will be responsible for timing one minute for each trial.
   - One official "counter" for the day. The others may count on their own, but the counter's readings will be the ones recorded.
   - One person who will hold the anemometer while the spins are counted; the person holding should make sure that he holds the anemometer so that the wind is unobstructed.
2. Mount or hold the anemometer in a place that has full access to the wind from all directions.
3. When the timekeeper says "Go", the counter in each group will count how many times the marked cup passes them in one minute and write it down.
4. If possible, repeat the above step four (4) times and record the average number of spins

   Optional: you can multiply the average number of spins by 60 to find out how many times the anemometer would spin in an hour and come up with a statement such as: the speed of the wind today is about 1,000 spins per hour.
