

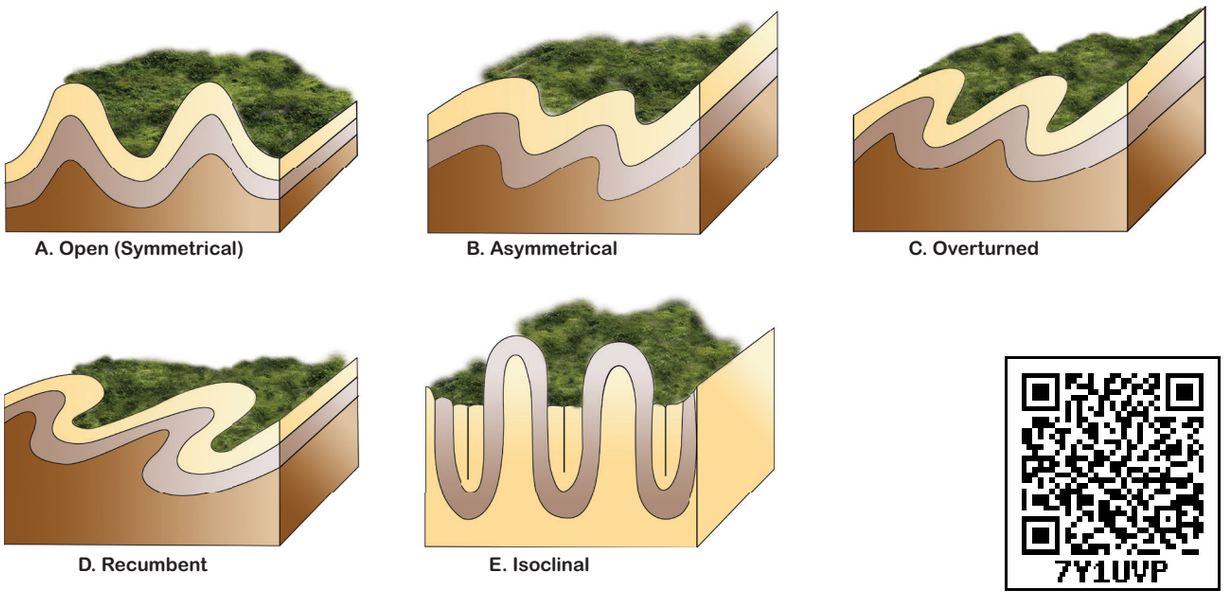

Figure 3.15 Types of Fold

3. **Isoclinal folds** are similar to symmetrical folds, but these folds both have the same angle and are parallel to each other. 'iso' means 'the same' (symmetrical), and 'cline' means 'angle,' so this name literally means 'the same angle.' So **isoclinal folds** are symmetrical and aligned in a parallel fashion.
4. When one limb of the fold is pushed over the other limb of the fold, it is called as **over turned fold**. Limbs are seldom horizontal.
