object by multiplying the magnification of the objective lens and magnification of the ocular lens.

- The compound light microscope uses visible light.
- The maximum resolving power (ability to distinguish two points) of a compound light microscope is 0.2 µm
- Oil immersion lens is used to reduce the light loss and increases the resolving power.

Types of Microscope:-

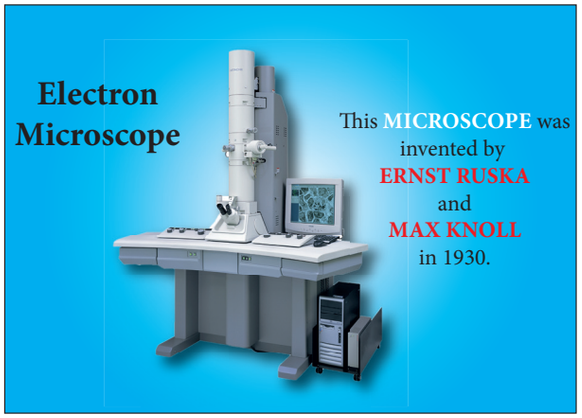

- Bright field microscope
- Dark field microscope
- Phase contrast microscope
- Flourescence microscope
- Electron microscope

Compound Light Microscope

Electron Microscope:

Electron microscope use beam of electrons and it has the magnification power of 10,000 to 1,00,000 x. It is used to view ultra-structure of viruses and other organisms

Preparation of specimens for light microscopy: -

Preparing smears and staining:

- A smear is a thin film of material used for microscopic examination. Place a drop of saline or distilled water and mix the specimen with a sterile inoculation loop.
- Spread the specimen uniformly on the slide.
- Fixing uses air and heat to attach microorganisms on a slide.

Staining: -

- Gram staining method
- Acid-fast staining method

In man's mouth alone over 40 million bacteria are living
