Sterilization: - is a process by which an article or surface or medium is free from Microorganism (vegetative, spore state)

Chemotherapy: - Treatment of a disease with chemical substance (sulfonamides).

Antibiotics: - An antimicrobial agent produced naturally by a bacterium (or) fungus.

e.g. - Ciprofloxacin
Streptomycin by
Streptomyces griseous.

Serum: A liquid remaining after blood plasma is clotted which contains immunoglobulin.

Local infection: - An infection that is localized within a particular part or a single organ. Proper care can control spread.

Systemic infection*:* -

An infection that affects the entire body. It can become fatal.

6.5 Infection Process

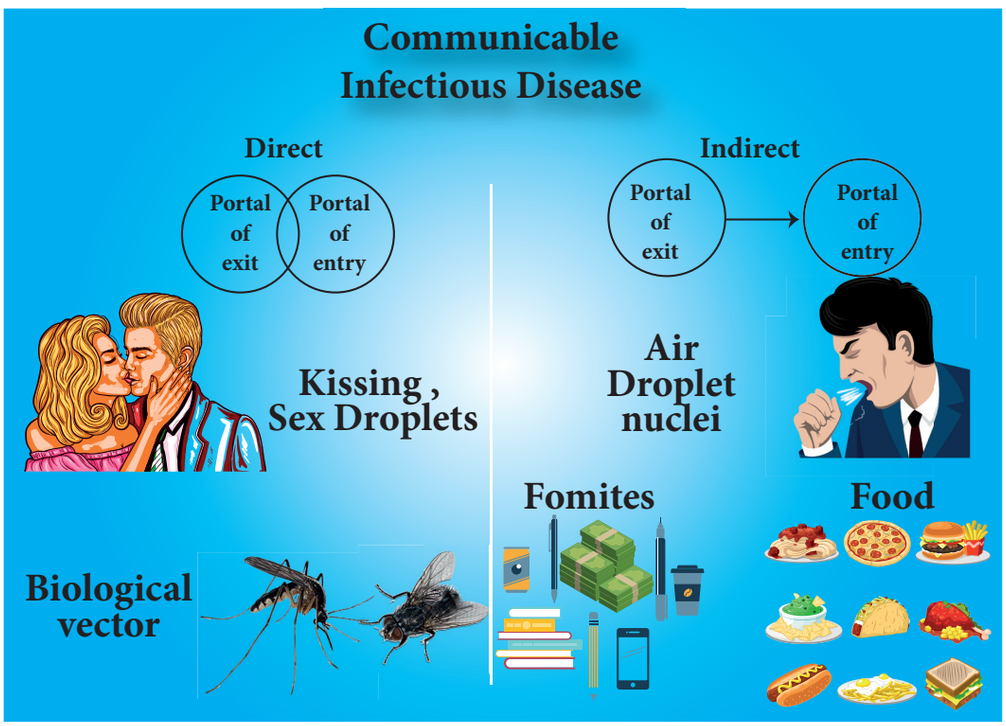

Infection is the invasion or colonization of the body by pathogenic microorganisms.

Disease occur when an infection results in any change from a state of health.

Development of an infection occurs in a cycle that depends on the following elements.

- An infectious agent or pathogen Ex. Salmonella
- A continual source of infection is called a reservoir of infection **(spread of infection)**
- A mode of transmission of disease
- A portal of entry to a host
- A susceptible host.

An infection will develop if this chain remains intact. Nurse use infection prevention and control practices to break the chain so that infection will not develop.
