6.5.3 Defense Against Infection: -

1. The immune system is one portion of the body's defense against infection.
2. Normal body flora that reside inside and outside of the body protect from several pathogens.
3. Skin and mucous membrane both prevent pathogens from entering the body by creating a barrier, mucous traps microorganisms.
4.
   - Skin & Mucous Membrane
   - Acidity of Skin,
   - Saliva, tears (Ig A)
   - Nostril hairs
   - Stomach Acidity

   } Provide first line of Defense against Infection it contains Ig A

   - The inflammatory response is a protective vascular and cellular reaction that neutralizes pathogens and repair body cells.

     Inflammatory response – bring blood and therefore more phagocytes to the area.
   - IgA is predominantly present in secretion (tears, saliva, milk) is the first line of defense.
   - Lysozyme is present in phagocytes which digest the foreign particles, break the cell wall of gram positive bacteria

Student Activity

Hanging drop technique -to observe the movement of microbes under microscope in different water sample

6.5.4 Types of Infection: -

Nosocomial Infection:-It is defined as any infections that are acquired during the course of stay in a hospital, nursing home, or other health care facility health care workers.

Iatrogenic Infection:-Iatrogenic infections are a type of nosocomial infection resulting from a diagnostic or therapeutic procedure.

i.e. UTI that develops after catheter insertion

- Exogenous
- Endogenous

Exogenous Infection: - Exogenous infection arises from microorganism external to the individual which do not exist as normal flora

Ex. Salmonella typhi – Typhoid fever

Endogenous Infection: - Endogenous infection occurs when part of the patient's normal flora becomes altered (virulent) and also increase in number it will become opportunistic infection. Ex. Streptococci in mouth

E. coli in intestine as normal flora which may cause UTI. When it reach the urinary bladder.
