8.2.3 Administering Oxygen Using Oxygen Tent

Definition

Process of administering oxygen by means of tent, usually for infants which gives maximum comfort and most satisfactory results.

Description

An Oxygen tent consists of a canopy over the baby's bed that may cover the baby fully or partially and is connected to a supply of oxygen. The canopies are transparent and enables the nurse to observe the sick baby.

Advantages

1. provides an environment for the patient with controlled oxygen concentration, temperature regulation and humidity control.
2. It allows freedom of movement in bed.

Disadvantages

1. It creates a feeling of isolation.
2. It requires high level of oxygen (10-12 litres per minute)
3. Loss of desired concentration occurs each time the tent is opened to provide care for the infant.
4. There is an increased chance of hazards due to fire.
5. It requires much time and effort to clean and maintain a tent.

Articles

Oxygen tent and oxygen source, humidifier.

Procedure

Sl.No	NURSING ACTION	RATIONALE
1	Explain and reassure the parents and child.	Helps in obtaining cooperation
2	Select the smallest tent and canopy that will achieve the desired concentration of oxygen and maintain patient comfort.	Increases the efficiency of the unit.
3	Tuck the edges of the tent under the mattress securely. This is especially important if the child is restless and can dislodge the tent by pulling the covers loose.	Dislodgement of tent leads to oxygen leakage.
