has the ability to greatly compromise wound healing. There are five ways to remove necrotic tissue.

1. **Autolytic debridement** is the use of moist dressings to promote autolysis with the body's own enzymes and white blood cells.
2. **Biological debridement**, or maggot debridement therapy, is the use of medical maggots to feed on necrotic tissue and therefore clean the wound of excess bacteria. Although this fell out of favor for many years, in January2004, the FDA approved maggots as a live medical device.
3. **Chemical debridement**, or enzymatic debridement, is the use of prescribed enzymes that promote the removal of necrotic tissue.
4. Mechanical debridement, is the use of debriding dressings, whirlpool or ultrasound for slough in a stable wound
5. Surgical debridement, or sharp debridement, is the fastest method, as it allows a surgeon to quickly remove dead tissue.

8.6.7.6 Dressing

Some guidelines for dressing are

Condition Cover dressing

None to moderate exudates - Gauze with tape or composite.

Moderate to heavy exudates - Foam dressing with tape or composite

Frequent soiling - Hydrocolloid dressing, film or composite

Fragile skin -Stretch gauze or stretch net

8.7 Back Care

8.7.1 Definition

Scientific form of massaging the back using different massaging strokes to provide cutaneous stimulation and thus promote comfort.

8.7.2 Purposes

- To relieve muscle tension
- To promote physical and mental relaxation.
- To relieve insomnia
- To stimulate blood circulation
- To assess the condition of skin
- To prevent bedsore

8.7.3 Contraindications

Patients with

- Rib fracture
- Burns
- Immediate post operative period after coronary artery bypass graft
- Spinal injuries
- Surgeries on back
- Lotion or oil

8.7.4 Articles Needed:-

- Lotion or oil
- Bath towel
- Bath blanket
- Soap
- Wash cloth
- Warm water in basin
- Mackintosh and draw sheet

If patient requires hygienic care, it should be provided, followed by massage
