or partially and is connected to a supply of oxygen. The canopies are transparent and enables the nurse to observe the sick baby.

Advantages

1. Provides an environment for the patient with controlled oxygen concentration, temperature regulation and humidity control.
2. It allows freedom of movement in bed.

Disadvantages

1. It creates a feeling of isolation.
2. It requires high level of oxygen (10-12 liters per minute)
3. Loss of desired concentration occurs each time the tent is opened to provide care for the infant.
4. There is an increased chance of hazards due to fire.
5. It requires much time and effort to clean and maintain a tent.

Articles

Oxygen tent and oxygen source, humidifier.

Procedure

	Nursing action	Rationale
1	Explain and reassure the parents and child.	Helps in obtaining cooperation
2	Select the smallest tent and canopy that will achieve the desired concentration of oxygen and maintain patient comfort.	Increases the efficiency of the unit.
3	Tuck the edges of the tent under the mattress securely. This is especially important if the child is restless and can dislodge the tent by pulling the covers loose.	Dislodgement of tent leads to oxygen leakage.
4	Pad the metal frame that supports the canopy.	Protects the child from injury.
5	Flush the tent with oxygen (increase the flow rate) after it has been opened for a period of time, to increase the concentration of the gas, then reset the flow meter to the original level.	Oxygen is circulated in the tent to adjust the concentration.
6	Analyze and record the tent atmosphere every 1-2 hours. Concentration of 30 to 50% can be achieved in well maintained tents.	Concentration varies with the efficiency of the tent, the rate of flow of oxygen, and the frequency with which tent is opened to the outside environment.
