The drugs used are:

Turpentine (1 part) well mixed with olive oil (3 parts) for adults. For children, turpentine (1 part) with olive oil (6 parts).

To apply the Turpentine Stupe:

Take the turpentine and the olive oil in the correct proportion, mix them well and warm it by keeping the container in a bowl of hot water. Apply the warm oil mixture over the part, apply the hot compresses and follow the procedure as in hot compresses. After 10 to 15 minutes, insert the flatus tube and watch the expulsion of the flatus.

Arm Soak and Foot Soak:

A soak refers to either immersing a body part (e.g. an arm, foot) in a solution or to wrap a part in gauze dressings and then saturating the dressing with a solution. Soaks may employ either "clean technique". A sterile technique is indicated for any open wounds present on the area. Soaks are usually indicated for any one of the following reasons:

1. To apply heat, thus hastening suppuration and softening the exudates.
2. To apply medications.
3. To cleanse areas such as wound in which there are sloughing tissues.
4. To relieve edema, ischemia and muscle spasm.

The body parts to receive the moist heat application is submerged in a basin of warm water at 105 to 110 degree F. The duration of the treatment is usually 20 minutes. Ideally the temperature of the solution should be checked frequently and additional solution is added or the solution is replaced in order to maintain the appropriate temperature. The client should be in a comfortable position and the limbs are supported with pillows. Dry the surface throughly at the end of the treatment.

Infrared Rays: (Infrared Lamp)

Infrared lamps transmit infrared rays, which are visible heat rays beyond the red end of the spectrum.

Ultraviolet Rays: (Ultraviolet Lamp)

Ultraviolet lamps transmit infrared ray, which are invisible heat rays beyond the visible spectrum at the violet end. Both these rays are used therapeutically for the production of heat in the tissues.

Therapeutic Uses:

1. Promotes healing of decubitus ulcer.
2. Softens connective tissue.
3. Relieves pain and spasm of the strained muscle.

The radiation heat produced by the infrared and ultraviolet lamps are more intense than the heat given off from the heating lamps. The effects of the exposure to the ultraviolet lamps are

1. Pigmentation of the skin.
2. Production of Vitamin-D.
3. Bactericidal effects.

The duration of the treatment is usually 20 to 30 minutes.
