the nurse prioritizes which diagnosis will receive the most attention first according to their severity and potential for causing more serious harm. For each problem a measurable goal/outcome is set. For each goal/outcome, the nurse selects nursing interventions that will help achieve the goal/outcome. A common method of formulating the expected outcomes is to use the evidence-based Nursing Outcomes Classification to allow for the use of standardized language which improves consistency of terminology, definition and outcome measures. The interventions used in the Nursing Interventions Classification again allow for the use of standardized language which improves consistency of terminology, definition and ability to identify nursing activities, which can also be linked to nursing workload and staffing indices. The result of this phase is a nursing care plan.

Implementing Phase

The nurse implements the nursing care plan performing the determined interventions that were selected to help meet the goals/ outcomes that were established. Delegated tasks and the monitoring of them is included here as well.

Activities

- pre-assessment of the client-done before just carrying out implementation to determine if it is relevant
- determine need for assistance
- implementation of nursing orders
- delegating and supervising-determines who to carry out what action

Evaluating Phase

The nurse evaluates the progress toward the goals/outcomes identified in the previous phases. If progress towards the goal is slow, or if regression has occurred, the nurse must change the plan of care accordingly. Conversely, if the goal has been achieved then the care can cease. New problems may be identified at this stage, and thus the process will start all over again.

2.9.2 Characteristics of Nursing Process

The nursing process is a cyclical and ongoing process that can end at any stage if the problem is solved. The nursing process exists for every problem that the individual/family/community has. The nursing process not only focuses on ways to improve physical needs, but also on social and emotional needs as well.

- Cyclic and dynamic
- Goal directed and client centred
- Interpersonal and collaborative
- Universally applicable
- Systematic

The entire process is recorded or documented in order to inform all members of the health care team.

SUMMARY

Thus there is a wide variety of health systems around the world, which as many histories and organizational structures. Implicitly nations must design and develop
