UNIT 6

Infection Control

LEARNING OBJECTIVES:

The students will be able to:

- list the types of immunity.
- list the most common microorganisms associated with disease in each type of immune deficiency.
- list the main laboratory methods for most of the infections in immune compromised patients.
- describe the infectious disease process (chain of infection).
- understand the problem of nosocomial infection and how to prevent them.
- describe hand hygiene procedures
- understand basic concepts of cleaning, disinfection and sterilization.
- understand the link between infection control, healthcare and Bio-medical waste management.

6.1 Introduction

Infection control refers to policies and procedures used to minimize the risk of spreading infection especially in hospital and human. Infection control is the discipline concerned with preventing nosocomial or healthcare associated infection, It is the practical sub discipline of epidemiology. Eventhough it is an essential, often under recognized and under supported part of the infrastructure of health care.

Infection control addresses factors related to the spread of infection within the healthcare setting (whether patient to patient and from patient to staff and from staff to patients). Practices that control and prevent transmission of infection help to protect patients and health workers from disease. Infection prevention and control is required to prevent the transmission of communicable disease in all health care settings. Risk factors that increase patient susceptibility to infection. Health care workers should be vaccinated against preventable disease such as hepatitis B. Personnel at risk for exposure to Tuberculosis and HIV-AIDS should be screened per recommendations
