infection. Therefore children need timely immunization. All children have a rights to get vaccines, protection against preventable disease. Extremely malnourished children may show severe reaction to certain vaccines because they have low antibodies. e.g. Measles Vaccine.

Advantages of live/killed Vaccine:

Live Vaccine:

ADVANTAGES	DISADVANTAGES
Single dose	Remote chance of reactivation of virus
Induce CMI	Cannot be used in immune compromised
Long lasting immunity	Need proper cold chain
Economical	
Suitable for mass immunization	

Killed Vaccine:

ADVANTAGES	DISADVANTAGES
Safe	Multiple dose
Stable	Booster dose needed
Can be given as combined vaccines	Does not induce local immunity

In the past 60 years vaccine helped to eradicate disease (small pox).

Maintaining a cold chain:

It is essential to maintain the favorable temperature with cold storage, to maintain the potency of vaccines. The temperature should be around 2°C to 8°C. The vaccine should be kept under freezing compartment. The thermometer should be placed in cold place to confirm the validity.

During transportation, the vaccines should be placed in a container maintaining the cited temperature or in a plastic bag in the ice box.

The Vaccines should be arranged according to their expiry dates for the better use.

Contraindications for the immunization:

- An acute illness with fever.
- When the child is on immune suppressive drug or on radiation.
- A child suffering from leukemia, lymphoma, malignancy.

Vaccine helped to reduce measles death globally by 78% between 2000-2008
