6.2.5 Infection & Its transmission:

1. Entry of infection into human body:

Microorganism may enter the body in one of the below three ways.

- Digestive tract – Swallowed in contaminated food or water.
- Respiratory tract – air contain pathogens
- Skin and mucous membrane – through a wound, weekend surface or injections

2. Organism leave the body of an infected person:

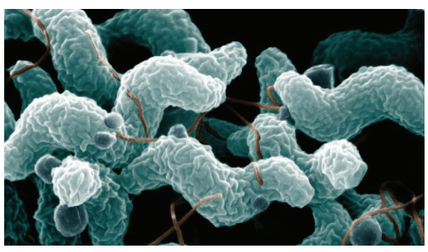

- Excreta – Feces and urine.
- Coughing and sneezing and sputum
- Pus and wound discharges
- Blood (Mosquito bite and injection needles)

3. Routes of transmission:

- Fecal to oral route.
- Feces to Skin.
- Droplet infection

4. Prevention of infection:

- Hand washing before preparing or eating food.
- Eating only clean food, kept free from flies.
- Handwashing after defecation.
- Drinking boiled water.
- Avoid crowded places.
- Immunization specially to protect children.
- Cover the mouth and nose when coughing.

Spirilla e.g. Campylobacter jejuni

6.3 Micro organism

6.3.1 Definition

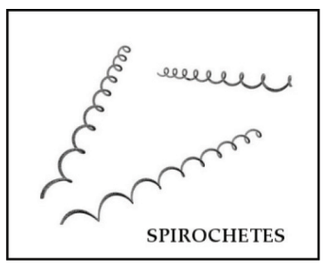

Microorganism or microbe is a living thing that is too small which is invisible to the naked eye but it can be visible under microscope. The study of microbes is called as microbiology.

Microorganisms are divided into **seven** types.

■ Bacteria	■ Fungi
■ Archea	■ Viruses
■ Protozoa	■ Multi cellular animal parasites (helminthes)
■ Algae	

Each type has a characteristic cellular composition morphology, motility or locomotion, reproduction.

Bacteria are prokaryotic organism. (single celled microbes). The cell structure is simple than that of other organism. Bacteria are classified into many groups according to the Morphology of Bacteria:

Spirochetes e.g. Treponema pallidum
