

Learning Objectives:

The students will learn the following:

- How to create web pages using HTML.
- What are the various structural tags available to create an HTML document.
- What are the various page formatting tags available and how to use them.

10.1 Introduction to HTML

In the previous sections you learnt about Internet and web pages, whatever you have seen on the web is a document written in **HTML (Hyper Text Markup Language).** HTML is a special markup language used to create web pages. This language tells the browsers, how to display the text, images, animations and other contents of a hypertext document on the screen. The language also tells how to make a document interactive through special hyper links.

HTML is not a word processing tool or a programming language. It is only a markup or page layout and hyperlink specification language. It describes the structure of a document.

HTML - Structural Tags

HTML was originally derived from SGML (Standard Generalized Markup Language) a larger, complicated document processing language. To learn HTML, no need to know about SGML.

10.2 Writing HTML document

HTML is a markup language. Writing in a markup language is very simple, directly you start the text of your web document and add special tags around words and paragraphs. The tags are coded by HTML commands or keywords that indicate how web browser should format and display the content.

HTML is made up of tags and its attributes. Tags are known as elements of HTML. Additional information such as colour, alignment etc., can be included with an HTML tag is known as attribute. Attributes are used to improve the appearance of an HTML document. You cannot create your own tags to create a new style or feature.
