Output will be:

11.1.5 Subscript and Superscript

A Subscript is a way to display a character or a number below the normal line of type. For example: The scientific notation for water is H_2O. It should be written as H_2O. Here, 2 is appearing below the normal line. This is called subscript.

A Superscript is also a way to show a character or a number above the normal line of type. For example: The familiar algebra equation "a plus b the whole square" should be written as $(a+b)^2$. Here, the square value 2 is appearing above the normal line. This is called superscript.

Usually, the subscript and the superscript character or number is smaller than the rest of the text.

In HTML, the **<sub>** and **<sup>** tags are used to create subscript and superscripts respectively. As like as other formatting tags, this is also a container tag.

The text or number given between **_{** and **}** will be displayed as subscript. Same as subscript, the text or number given between **^{** and **}** will be displayed as superscript.
