If you want to use a particular tag with the same style applied in one HTML document to another is not possible. Thus, the <style> tags are called as **"Page-Level Styles"** or "**Internal Style sheets".**

The "Internal Style sheet" is defined and implemented only within an HTML document. If you want use the same style to multiple pages, you should define styles as a separate style file. These separate style files are known as **"Sitewide Style sheets" or "External Style Sheets".** Professional web developers do not use internal styles.

There is another style method called **"Inline style"** ,which is used to define style for a particular tag anywhere in an HTML document. You can define styles for any tag within an HTML document. But it is applicable only on that line where it is defined . If you use the same tag, again in the same document, it does not reflect the new style.

In this chapter, we are going to discuss about External Style Sheets or Sitewide Style Sheets that is about CSS.

Sitewide Style Sheets:

Cascading Style Sheets (CSS) are also called as Sitewide Style sheets or external style. CSS is a style sheet language used for describing the formatting of a document written in HTML. Using CSS, you can control the font colour, font style, spacing between pages, columns size, border colour, background image or colour and various other effects in a web page. In external styles, you can store all style information in a separate file and include it in your web pages using an HTML tag. The separate file should be saved with the extension .css

Advantages of CSS

Maintainability -CSS are also defined and stored as separate files. So, the style and appearance of a web page can be dynamically changed and maintain with less effort.

Reusability - The styles defined in CSS can be reused in multiple HTML pages.

Easy to understand - The tags in web pages are well organized with style specifications and therefore it is easy to understand.

HakonWium Lie

CSS was invented by **HakonWium Lie** on October ,10 1994 and maintained through a group of people within the W3C called the CSS Working Group.

CSS – Style definition rules

The body of the style sheet consists of a series of rules.

Selector **Declaration**

HTML Tag **{ Properties : Values; }**
