Introduction to JavaScript

Learning Objectives:

- To understand about JavaScript Language and advantages of JavaScript
- To understand the importance of Client side code, Steps to follow to JavaScript Programs.
- To understand JavaScript Variables, Declaring Variables and Rules for naming Variables – Scope of Variables and assigning values to variables.
- To develop the skills of Web page development using HTML and CSS
- To acquire the skills of web scripting using JavaScript
- To develop the skills of Internet and Online applications

14.1 Introduction to JavaScript:

On December 4, 1995, Netscape and Sun Inc. jointly introduced JavaScript 1.0. JavaScript had truly bridged the gap between the simple world of HTML and the more complex Common Gateway Interface (CGI) programs on the Server. It provides a common scripting language for Web developers to design, test and deploy Internet Applications.

The JavaScript client-side technology provides many advantages over traditional CGI Server-side scripts. For example, JavaScript code can be used to check if the user has entered a valid e-mail address in a form field. The JavaScript code is executed when the user click **Submit** button in the form, and only if all the entries are valid, they would be submitted to the Web Server.

14.2 Advantages of JavaScript Programming Language

- In HTML chapter we have learnt how to develop static web pages. But in real life web pages must be interactive. So to develop such interactive pages (Dynamic Web page) JavaScript programming language is used.
- User entered data in the Dynamic Web page can be validated before sending it to the server. This saves server traffic, which means less load on your server.
- JavaScript includes such items as Textboxes, Buttons, drag-and-drop components and sliders to give a Rich Interface to site visitors. For example Creating a New email account in any service provider.

14.3 Using JavaScript in HTML page with <script> tag :

JavaScript can be implemented using <script>... </script> tags. The <script> tag containing JavaScript can be placed anywhere within in the web page, but it is normally recommended that should be kept it within the <head> tags. The <script> tag alerts the
