character.

2. The rest of the variable name can include any letter, any number, or the underscore. You can't use any other characters, including spaces, symbols, and punctuation marks.
3. JavaScript variable names are case sensitive. That is, a variable named **RegisterNumber** is treated as an entirely different variable than one named **registernumber.**
4. There is no limit to the length of the variable name.
5. JavaScript's reserved words cannot be used as a variable name. All programming languages have a supply of words that are used internally by the language and that cannot be used for variable names.

### 14.5.3 Scope of variables

The scope of a variable is the life time of a variable of source code in which it is defined.

- A global variable has global scope; it can be defined everywhere in the JavaScript code.
- Variables declared within a function are defined only within the body of the function. They are local variables and have local scope.

### 14.5.4 Assigning values to variables

Variables can be assigned initial values when they are declared as follows:

```
var numericData1 = 522;
var stringData = "JavaScript has strings\n It sure does";
var numericData = 3.14;
var booleanData = true;
```

**Illustration 14.2 Declaring Variables**

```
<Html>
<Head>
        <Title>Demo Program - Declaring Variables in JavaScript </Title>
        </Head>
        <Body>
        <script language="javascript" type="text/javascript">
        var numericData1 = 522;
        var stringData = " JavaScript has strings\n It sure does";
        var numericData = 3.14;
        var booleanData = true;
        document.write("Numeric Data : "+numericData1);
        document.write("<br> String  Data   :  "+stringData);
        document.write("<br> Floating  Data : "+numericData);
        </script>
        </Body>
</Html>
```
