is used by the respective users. To address this issue, fields such as data mining, Machine learning have emerged. Data mining an interdisciplinary sub field of computer science is the computational process of discovering patterns in large data sets involving methods such as artificial intelligence and statistics. Persons trained in statistics with computing knowledge have been working as data analytics to analyze such huge data.

1.4.8 Statistics and Government

Statistics provides statistical information to government to evolve policies, to maintain law and order, to promote welfare schemes and to other schemes of the government. In other words, statistical information is vital in overall governance of the state. For instance statistics provide information to the government on population, agricultural production, industrial production, wealth, imports, exports, crimes, birth rates, unemployment, education, minerals and so on.

1.5 Big Data

Big Data is a term used for a collection of data sets that are large and complex, which is difficult to store and process using available database management tools or traditional data processing applications. Daily we upload millions of bytes of data. 90 % of the world's data has been created in last few years.

Applications of Big Data

We cannot talk about data without talking about the people, because those are the once who are getting benefited by Big Data applications. Almost all the industries today are leveraging Big Data applications in one or the other way.

Smarter Healthcare: Making use of the petabytes of patient's data, the organization can extract meaningful information and then build applications that can predict the patient's deteriorating condition in advance.

Retail: Retail has some of the tightest margins, and is one of the greatest beneficiaries of big data. The beauty of using big data in retail is to understand consumer behavior. Suggestion based on the browsing history of the consumer, they supply their product to increase their sales.

Manufacturing: Analyzing big data in the manufacturing industry can reduce component defects, improve product quality, increase efficiency, and save time and money.
