Traffic control: Traffic congestion is a major challenge for many cities globally. Effective use of data and sensors will be key to managing traffic better as cities become increasingly densely populated.

Search Quality: Every time we are extracting information from google, we are simultaneously generating data for it. Google stores this data and uses it to improve its search quality.

Sales promotion: Prominent sports persons or celebrities are selected as Brand Ambassadors for their products by the prominent industries through big data got from social media or from other organizations.

Challenges with Big Data

We have a few challenges which come along with Big Data those are data complexity, storage, discovery analytics and lack of talent. But we have several advance programming language that can handle the issue of Big data, like Hadoop, Mapreduce, Scale etc., and many of this languages like open source, Java-based programming framework that supports the storage and processing of extremely large data sets in a distributed computing environment.

1.6 Variable and Types of Data

Information, especially facts or numbers collected for decision making is called data. Data may be numerical or categorical. Data may also be generated through a variable.

Variable: A variable is an entity that varies from a place to place, a person to person, a trial to trial and so on. For instance the height is a variable; domicile is a variable since they vary from person to person.

A variable is said to be quantitative if it is measurable and can be expressed in specific units of measurement (numbers).
