Measures of Dispersion

Karl Pearson
(27 March 1857 – 27 April 1936)

Karl Pearson was an English mathematician and biostatistician. He has been credited with establishing the discipline of mathematical statistics. He founded the world's first university Statistics department at University College London in 1911, and contributed significantly to the field of biometrics, meteorology, theories of social Darwinism and eugenics. In fact, Pearson devoted much time during 1893 to 1904 in developing statistical techniques for biometry. These techniques, which are widely used today for statistical analysis.

'The never was in the world two opinions alike, no more than two hairs or two grains; the most universal quality is diversity'.
- Michel de Montaigne

Learning Objectives

- Provides the importance of the concept of variability (dispersion)
- Measures the spread or dispersion and Identifiers the causes of dispersion
- Describes the spread - range and standard deviations
- Describes the role of Skewness and Kurtosis
- Explains about moments
- Illustrates the procedure to draw Box plot.

BB5LT4

Introduction

The measures of central tendency describes the central part of values in the data set appears to concentrate around a central value called average. But these measures do
