Table 3.4

Average Yield of Rice during 2014 - 15

State	Yield (Kg/hec)
Tamilnadu	3191
Karnataka	2827
Kerala	2818
Uttarpradesh	2082
West Bengal	2731

3.2.3 Classification by Attributes or Qualitative classification

The method of classifying statistical data on the basis of attribute is said to be classification by attributes or qualitative classification. Examples of attributes include nationality, religion, gender, marital status, literacy and so on.

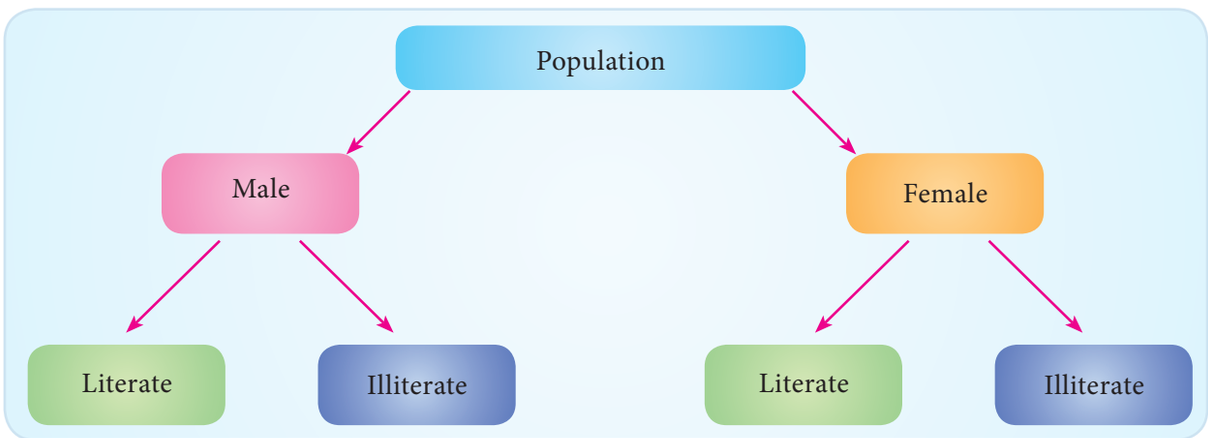

Fig: 3.1

Classification according to attributes is of two kinds: simple classification and manifold classification.

In simple classification the raw data are classified by a single attribute. All those units in which a particular characteristic is present are placed in one group and others are placed in another group. The classification of individuals according to literacy, gender, economic status would come under simple classification.

In manifold classification, two or more attributes are considered simultaneously. When more attributes are involved, the data would be classified into several classes and subclasses depending on the number of attributes. For example, population in a country can be classified in terms of gender as male and female. These two sub-classes may be further classified in terms of literacy as literate and illiterate.
