While classifying the data according to attributes, it is essential to ensure that the attributes involved have to be defined without ambiguity. For example, while classifying income groups, the investigator has to define carefully the different non-overlapping income groups.

Example 3.5

The classification of students studying in a school according to gender is given in Table 3. 5

Table 3.5

Gender-wise and class-wise information about students in a School

Class	Boys	Girls
VI	82	34
VII	74	43
VIII	92	27
IX	87	32
X	90	30
XI	75	25
XII	78	22

3.2.4 Classification by Size or Quantitative Classification

When the characteristics are measured on numerical scale, they may be classified on the basis of their magnitude. Such a classification is known as classification by size or quantitative classification. For example data relating to the characteristics such as height, weight, age, income, marks of students, production and consumption, etc., which are quantitative in nature, come under this category.

Colours of vegetables, Types of vegetables	Qualitative data (Non-numerical)
Weight of vegetables, Cost of vegetables	Quantitative data (Numerical)

Example 3.6

The classification of data relating to nutritive values of three items measured per 100 grams is provided in Table 3.6
