Table 3.6

Nutritive values of Sugar, Jaggery and Honey

Item	Energy K calories	Carbohydrate (in gm)	Calcium (in mg)	Iron (in mg)
Sugar	398	99.4	12	0.15
Jaggery	383	95.0	80	2.65
Honey	313	79.5	5	0.69

In the classification of data by size, data may also be classified deriving number of classes based on the range of observations and assigning number of observations lying in each class. The following is another example for classification by size.

Example 3.7

The classification of 55 students according to their marks is given in Table 3.7

Table 3.7

Classification of students with respect to their marks

Marks	0 - 5	5 - 10	10 - 15	15 - 20	20 - 25	25 – 30	30 - 35
Number of Students	2	6	13	17	11	4	2

Rules for Classification of Data

There are certain rules to be followed for classifying the data which are given below.

- The classes must be exhaustive, i.e., it should be possible to include each of the data points in one or the other group or class.
- The classes must be mutually exclusive, i.e., there should not be any overlapping.
- It must be ensured that number of classes should be neither too large or nor too small. Generally, the number of classes may be fixed between 4 and 15.
- The magnitude or width of all the classes should be equal in the entire classification.
- The system of open end classes may be avoided.
