(i) The company earned the maximum profit before paying the tax in the year 2015.

(ii) The company earned the minimum profit after paying the tax in the year 2017.

(iii) The average profit earned before paying the tax $= \frac{700}{4}$ = ₹ 175 lakhs

The average profit earned after paying the tax $= \frac{244}{4}$ = ₹ 61 lakhs

Hence, difference between the average profit earned by the company before paying the tax and after paying the tax is

= 175 – 61 = ₹ 114 lakhs.

4.3.4 Component Bar Diagram(Sub-divided Bar Diagram)

A component bar diagram is used for comparing two or more sets of statistical data, as like multiple bar diagram. But, unlike multiple bar diagram, the bars are stacked in component bar diagrams. In the construction of sub-divided bar diagram, bars are drawn with equal width such that the heights of the bars are proportional to the magnitude of the total frequency. The bars are positioned with equal space. Each bar is sub-divided into various parts in proportion to the values of the components. The subdivisions are distinguished by different colours or shades. If the number of clusters and the categories in the clusters are large, the multiple bar diagram is not attractive due to more number of bars. In such situation, component bar diagram is preferred.

Example 4.4

Total expenditure incurred on various heads of two schools in an year are given below. Draw a suitable bar diagram.

Expenditure Head	Amount (in lakhs)	
	School I	School II
Construction/Repairs	80	90
Computers	35	50
Laboratory	30	25
Watering plants	45	40
Library books	40	30
Total	230	235

Which school had spent more amount for

(a) construction/repairs (b) Watering plants?
