Cirque is a glacially eroded rock basin, with a steep side wall and steep head wall, surrounding an armchair-shaped depression. E.g. *Corrie* – Scotland (United Kingdom), *Kar* – Germany.

As the ice melts, they get filled up the cirque with water and become beautiful lakes in the mountains called as ***Tarn Lake.*** When two adjacent cirques erode towards each other, the previously rounded landscape is transformed into a narrow rocky, steep – sided ridges called ***Arete.***

Arete

U' Shaped Valley is found beneath the glaciers which is deepened and widened by the lateral and vertical erosion. The material carried by the glacier such as rocks - big and small, sand and silt get deposited. These deposits form ***glacial moraines***.

Moraine

Wind

Have you ever visited a desert? Try to collect some pictures of sand dunes. An active agent of erosion and deposition in the deserts is ***wind***.

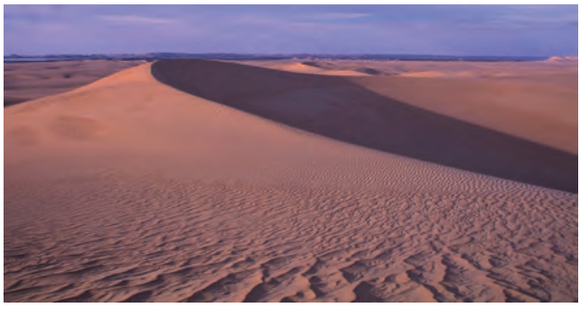

Mushroom Rock

Winds erode the lower section of the rock more than the upper part. Therefore, such rocks have narrower base and wider top. Wider top rocks in the shape of a mushroom, commonly called ***mushroom rocks.*** An isolated residual hill, standing like a pillar with rounded tops are called ***Inselbergs.*** E.g. Inselberg in the Kalahari Desert of South Africa.

Inselberg

When the wind blows, it lifts and transports sand from one place to another. When it stops blowing the sand falls and gets deposited in low hill – like structures. These are called ***sand dunes***. The crescent shaped sand dunes are called ***Barchans.***

Barchans
