**Problem 1.3**

Find the volume of the following (Take $\pi = 22/7$).

a. A cube whose side is 3 cm.

b. A cylinder whose radius is 3 m and height is 7 m.

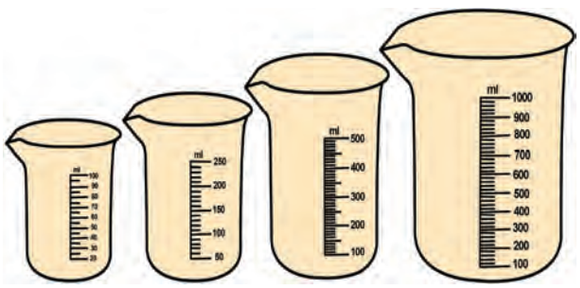

**Solution**

a. Volume of a cube = side × side × side
= 3 cm × 3 cm × 3 cm = 27 cubic cm or $cm^3$.

b. Volume of a cylinder = $\pi \times (\text{radius})^2 \times \text{height}$
= $22/7 \times 3 \times 3 \times 7 = 198\ m^3$.

### 1.3.2 Volume of Liquids

Liquids also occupy some space and hence they also have volume. But, liquids do not possess any definite shape. So, the volume of a liquid cannot be determined as in the case of solids. When a liquid is poured into a container, it takes the shape and volume of the container. The volume of any liquid is equal to the space that it fills and it can be measured using a measuring cylinder or measuring beaker. The maximum volume of liquid that a container can hold is known as the capacity of the container. A measuring container is graduated as shown in figure.

**Measuring containers**

The volume of a liquid is equal to the volume of space it fills in the container. This can be directly observed from the readings marked in the measuring containers. If we notice the measuring cups given in figure carefully, we can observe that the readings are marked in the unit of 'ml'. This actually represents millilitre. To understand this unit of volume, let us first understand how much a litre means. Litre is the commonly used unit to measure the volume of liquids. We know that the unit of volume is cubic cm if the dimensions of the object are given in cm. This cubic cm is commonly known as 'cc'. A volume of 1000 cc is termed as one litre (*l*).

1 litre = 1000 cc or $cm^3$

1000 ml = 1 litre

### 1.3.3 Volume of irregularly shaped objects

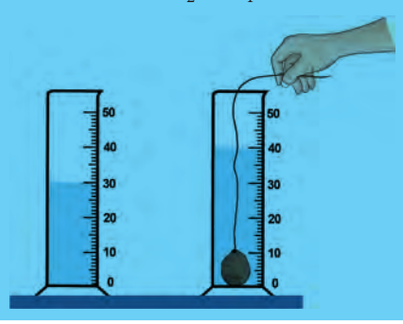

There is no formula to determine the volume of irregularly shaped objects as in the case of area. For such objects, volume can be determined using a measuring cylinder and water.

5VZN19

**ACTIVITY 3**

Take a measuring cylinder and pour some water into it (Do not fill the cylinder completely). Note down the volume of water from the readings of the measuring cylinder. Take it as $V_1$. Now take a small stone and tie it with a thread. Immerse the stone inside the water by holding the thread. This has to be done such that the stone does not touch the walls of the measuring cylinder. Now, the level of water will raise. Note down the volume of water and take it as $V_2$. The volume of the stone is equal to the raise in the volume of water.

Volume of stone = $V_2 - V_1$
