stamens are fused to form two bundles each containing five stamens (5)+(5). Stamens are **monadelphous** and **dimorphic** ie. 5 stamens have longer filaments and other 5 stamens have shorter filaments thus the stamens are found at two levels and the shape of anthers also varies in (*Crotalaria verrucosa)*. (5 anthers are long and lanceolate, and the other 5 anthers are short and blunt). Anthers are dithecous,
