The intangible benefits of video conferencing include more efficient meetings with the exchange of non-verbal communications and a stronger sense of community among business contacts, both within and between companies, as well as with customers. On a personal level, the face-to-face connection adds non-verbal communication to the exchange and allows participants to develop a strange sense of familiarity with individuals they may never actually meet in person.

8.10.4. Auto Call Back Up:

In telecommunication, an automatic callback is a computer telephony calling feature that permits a user, when encountering a busy condition or other condition where the called individual is unavailable, to instruct the system to retain the called number and to establish the call when there is an available line or when the called number is no longer busy. Automatic call back may be implemented in the terminal, in the telephone exchange, or shared between them. To activate the call back service, a call should be made to the local access number, let the phone ring once, and then hand up. This is a signal to the call back computer to call the speakers back and give them a dial tone on their local phone network.

8.10.5. Website:

A website is a collection of related web pages, including multimedia content, typically identified with a common domain name and published on atleast one web server. A website may be accessible via a public Internet Protocol (IP) network such as the internet, or a private local area network (LAN), by referencing a Uniform Resource Locator (URL) that identifies the site.

Websites can have many functions and can be used in various fashions; a website can be a personal website, a commercial website for a company, a Government website or a net profit organization website. Websites are typically dedicated to a particular topic or purpose, ranging from entertainment and social networking to provide news and education. All public accessible websites collectively constitute the worldwide web, while private websites such as a company's websites for its employees, are typically a part of an internet.

Web pages which are the building blocks of websites, are documents, typically composed in plain text interspersed with formatting instructions of Hypertext Markup Language (HTML, X HTML). They may incorporate elements from other websites with suitable markup anchors. Web pages are accessed and transported with the Hypertext Transfer Protocol (HTTP), which may optionally employ encryption (HTTP secure, HTTPs) to provide security and privacy for the user. The user's application, after a web browser, renders the page content according to its HTML, markup instructions on to a display terminal.

Hyper linking between web pages conveys to the reader the site structure and guides the navigation of the site, which often starts with a home page containing a directory of the site web content. Some
